Probability Distributions

Poisson

The Poisson distribution is used to model a situation where an event occurs at a fixed rate.

You can model X as a Poisson distribution if:

- The events must occur independently
- They must occur singly in space or time
- The events must occur at a constant average rate

	Formula Book	
If $X \sim \text{Po}(\lambda)$, then	$P(X = x) = \frac{e^{-\lambda} \lambda^x}{x!}$	$(x \geq 0)$

Geometric

The Geometric distribution is used to model a situation where you try an event several times until a success occurs, and you want to know how many tries it will take.

You can model X as a Geometric distribution if:

- Each attempt is independent
- Each attempt has the same probability

	Formula Book	
If $X \sim \text{Geo}(p)$, then	$P(X = x) = p(1 - p)^{x-1}$	$(x > 0)$

Remember	
$P(X \leq x) = 1 - (1 - p)^x$	$P(X \geq x) = (1 - p)^{x-1}$
$P(X > x) = (1 - p)^x$	$P(X < x) = 1 - (1 - p)^{x-1}$
