Binomial Expansion

Definitions

The factorial
$$n! \equiv n \times (n-1) \times (n-2) \times \cdots \times 3 \times 2 \times 1$$
.

The falling factorial $n^{\underline{k}} \equiv n \times (n-1) \times (n-2) \times \cdots \times (n-(k-2)) \times (n-(k-1))$. It has k terms.

$$0! = n^{\underline{0}} = 1$$

The choose function
$${}^{n}C_{r} \equiv \boxed{\begin{pmatrix} n \\ r \end{pmatrix} \equiv \frac{n!}{r!(n-r)!}}$$

Expansions

For a natural number n, the expansion of $(a+b)^n$ is

$$a^{n} + na^{n-1}b + \binom{n}{2}a^{n-2}b^{2} + \cdots + \binom{n}{r}a^{n-r}b^{r} + \cdots + b^{n}$$

In general,
$$(a+b)^n = \sum_{r=0}^n \binom{n}{r} a^{n-r} b^r \ (n \in \mathbb{N})$$

That's true if n is a natural number, but there is a version that works for all real numbers. For an expression $(a+bx)^n$, it should first be normalised to $a^n(1+\frac{b}{a}x)^n$. Let $y=\frac{b}{a}x$. Then the expansion of $(1+y)^n$ is given by

$$1 + ny + \frac{n(n-1)}{2!}y^2 + \frac{n(n-1)(n-2)}{3!}y^3 + \dots + \frac{n(n-1)(n-2)\cdots(n-(r-1))}{r!}y^r + \dots$$

In general,
$$(a+bx)^n = a^n \sum_{r=0}^{\infty} \frac{n^r}{r!} \left(\frac{b}{a}x\right)^r \ (n \in \mathbb{R})$$

Calculus

Elementary Derivatives

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

f	C	x^n	$\sin x$	$\cos x$	a^x	$\ln x$
f'	0	nx^{n-1}	$\cos x$	$-\sin x$	$a^x \ln a$	$\frac{1}{x}$

Composition Laws

Let f and g be differentiable functions over x.

The ' mark denotes the derivative with respect to x, so $f' = \frac{df}{dx}$ and $g' = \frac{dg}{dx}$.

The \circ symbol denotes function composition, so $(f \circ g)(x) = f(g(x))$.

$$(f \pm g)' = f' \pm g'$$
 $(fg)' = fg' + f'g$

$$(f \circ g)' = (f' \circ g)g'$$

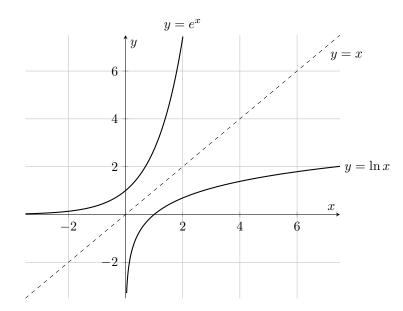

$$\left(\frac{f}{g}\right)' = \frac{f'g - fg'}{g^2}$$

Integral Tricks

For integrals of the form on the left, consider the function on the right.

Exponentials and Logarithms

Exponentials

$$\frac{d}{dx}e^x = e^x$$

$$\frac{d}{dx}e^{kx} = ke^{kx}$$

$$\frac{d}{dx}e^{f(x)} = f'(x)e^{f(x)}$$

 $\ln x$ is the inverse of e^x , meaning its graph is reflected in the line y = x.

Log Laws

$$\log_a b \equiv \frac{\ln b}{\ln a}$$

$$\log xy \equiv \log x + \log y$$

$$\log \frac{x}{y} \equiv \log x - \log y$$

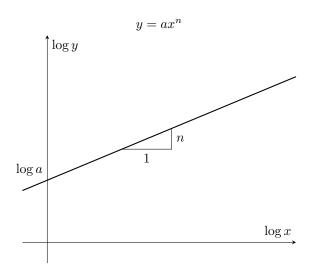

$$\log x^y \equiv y \log x$$

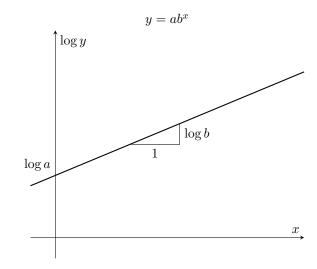

$$\log_a a \equiv 1$$

$$\log 1 \equiv 0$$

$$\log \frac{1}{x} \equiv -\log x$$

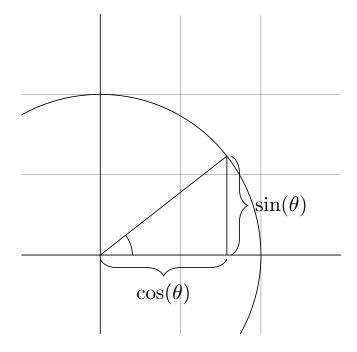

Log Plots

Trigonometry

Definitions

$$\tan \theta \equiv \frac{\sin \theta}{\cos \theta}$$

$$\sec \theta \equiv \frac{1}{\cos \theta}$$

$$\csc\theta \equiv \frac{1}{\sin\theta}$$

$$\cot \theta \equiv \frac{1}{\tan \theta} \equiv \frac{\cos \theta}{\sin \theta}$$

<u>Identities</u>

$$\sin^2\theta + \cos^2\theta \equiv 1$$

$$1 + \tan^2 \theta \equiv \sec^2 \theta$$

$$1 + \cot^2 \theta \equiv \csc^2 \theta$$

$$\sin(\alpha \pm \beta) \equiv \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$$

$$\cos(\alpha \pm \beta) \equiv \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$$

$$\tan(\alpha \pm \beta) \equiv \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$$

$$\sin 2\theta \equiv 2\sin\theta\cos\theta$$

$$\tan 2\theta \equiv \frac{2\tan \theta}{1 - \tan^2 \theta}$$

$$\cos 2\theta \equiv \cos^2 \theta - \sin^2 \theta$$
$$\equiv 2\cos^2 \theta - 1$$
$$\equiv 1 - 2\sin^2 \theta$$

<u>Calculus</u>

$$\frac{d}{dx}\sin x = \cos x$$

$$\int \sin x \, dx = -\cos x + C$$

$$\frac{d}{dx}\cos x = -\sin x$$

$$\int \cos x \, dx = \sin x + C$$

$$\int \tan x \, dx = \ln|\sec x| + C$$

$$\int \tan x \, dx = \ln|\sec x| + C$$

$$\int \sec x \, dx = \ln|\tan x + \sec x| + C$$

$$\int \csc x \, dx = \ln|\tan x + \sec x| + C$$

$$\int \csc x \, dx = -\ln|\cot x + \csc x| + C$$

$$\int \cot x \, dx = -\ln|\cot x + \csc x| + C$$

$$\int \cot x \, dx = \ln|\sin x| + C$$

$$\int \cot x \, dx = \ln|\sin x| + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x + C$$

$$\int \cot x \, dx = -\cot x$$

 $\int \arctan x \ dx = x \arctan x - \frac{\ln(x^2 + 1)}{2} + C$

 $\frac{d}{dx}\arctan x = \frac{1}{x^2 + 1}$

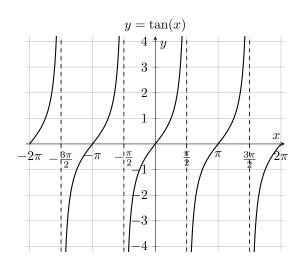

Graphs

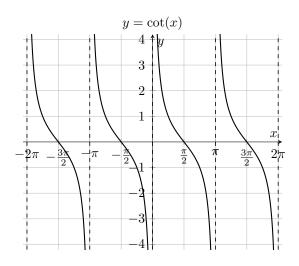

Probability Distributions

Binomial

The binomial distribution is used to model a situation with a fixed number of independent trials each with a constant probability of success.

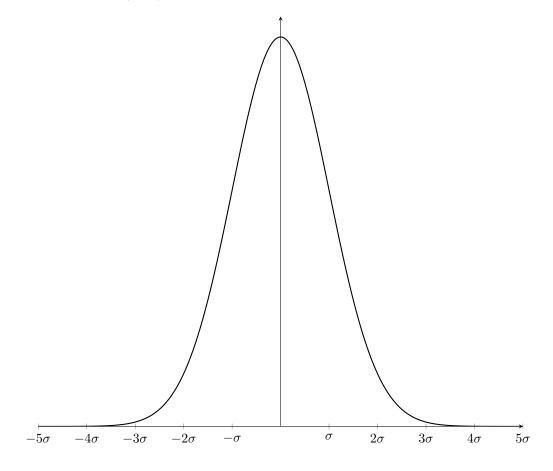

You can model X as a binomial distribution if:

- There a fixed number of trials, n
- Each trial must succeed or fail
- There is a fixed probability of success, p
- Each trial is independent

If
$$X \sim B(n, p)$$
, then $P(X = x) = \binom{n}{x} p^x (1 - p)^{n - x}$ $(0 \le x \le n)$

Normal

The normal distribution $X \sim N(\mu, \sigma^2)$ is symmetrical, meaning the mean and median are equal.

Probability Distributions

<u>Poisson</u>

The Poisson distribution is used to model a situation where an event occurs at a fixed rate.

You can model X as a Poisson distribution if:

- The events must occur independently
- They must occur singly in space or time
- The events must occur at a constant average rate

If
$$X \sim Po(\lambda)$$
, then $P(X = x) = \frac{e^{-\lambda}\lambda^x}{x!}$ $(x \ge 0)$

<u>Geometric</u>

The Geometric distribution is used to model a situation where you try an event several times until a success occurs, and you want to know how many tries it will take.

You can model X as a Geometric distribution if:

- Each attempt is independent
- Each attempt has the same probability

If
$$X \sim Geo(p)$$
, then $P(X = x) = p(1-p)^{x-1}$ $(x > 0)$

- $P(X \le x) = 1 (1 p)^x$
- $P(X > x) = (1 p)^x$
- $P(X \ge x) = (1-p)^{x-1}$
- $P(X < x) = 1 (1 p)^{x-1}$

Problem Solving Matters

General Tips

- Be lazy; only do necessary work
- Write in sentences to explain (especially in proofs)
- Avoid long and/or complicated calculations
- Draw diagrams and make them big
- In diagrams, label things and add lines
- Look for similar shapes (often triangles)

Tips For Sketching Graphs

- Look for symmetries
- Think about periodicity
- Look for turning points (0 derivative)
- Look for asymptotes
- Try values of x like 0, 1, -1, etc.
- If there's a trig function involved, try multiples of π
- See what happens when x tends to 0 or $\pm \infty$

Things To Remember

- $\log_a b \times \log_b a = 1$
- $\log_{a^c} b^c = \log_a b$
- When graphing $y^2 = f(x)$, draw the positive branch of $y = \sqrt{f(x)}$ and reflect it in the x axis
- $\log x$ is negative when 0 < x < 1
